

Asset Allocation

JUNE 4, 2026

The Council's Role in Asset Allocation

- The primary investment objective for SDRS assets is to achieve and exceed the return of the Council's Capital Markets Benchmark over the long term
- The key investment policy decision relates to asset allocation
- The Council establishes:
 - A benchmark asset allocation which considers expected long-term returns and risk
 - Minimum and maximum allocations for each asset category

Discussion Topics

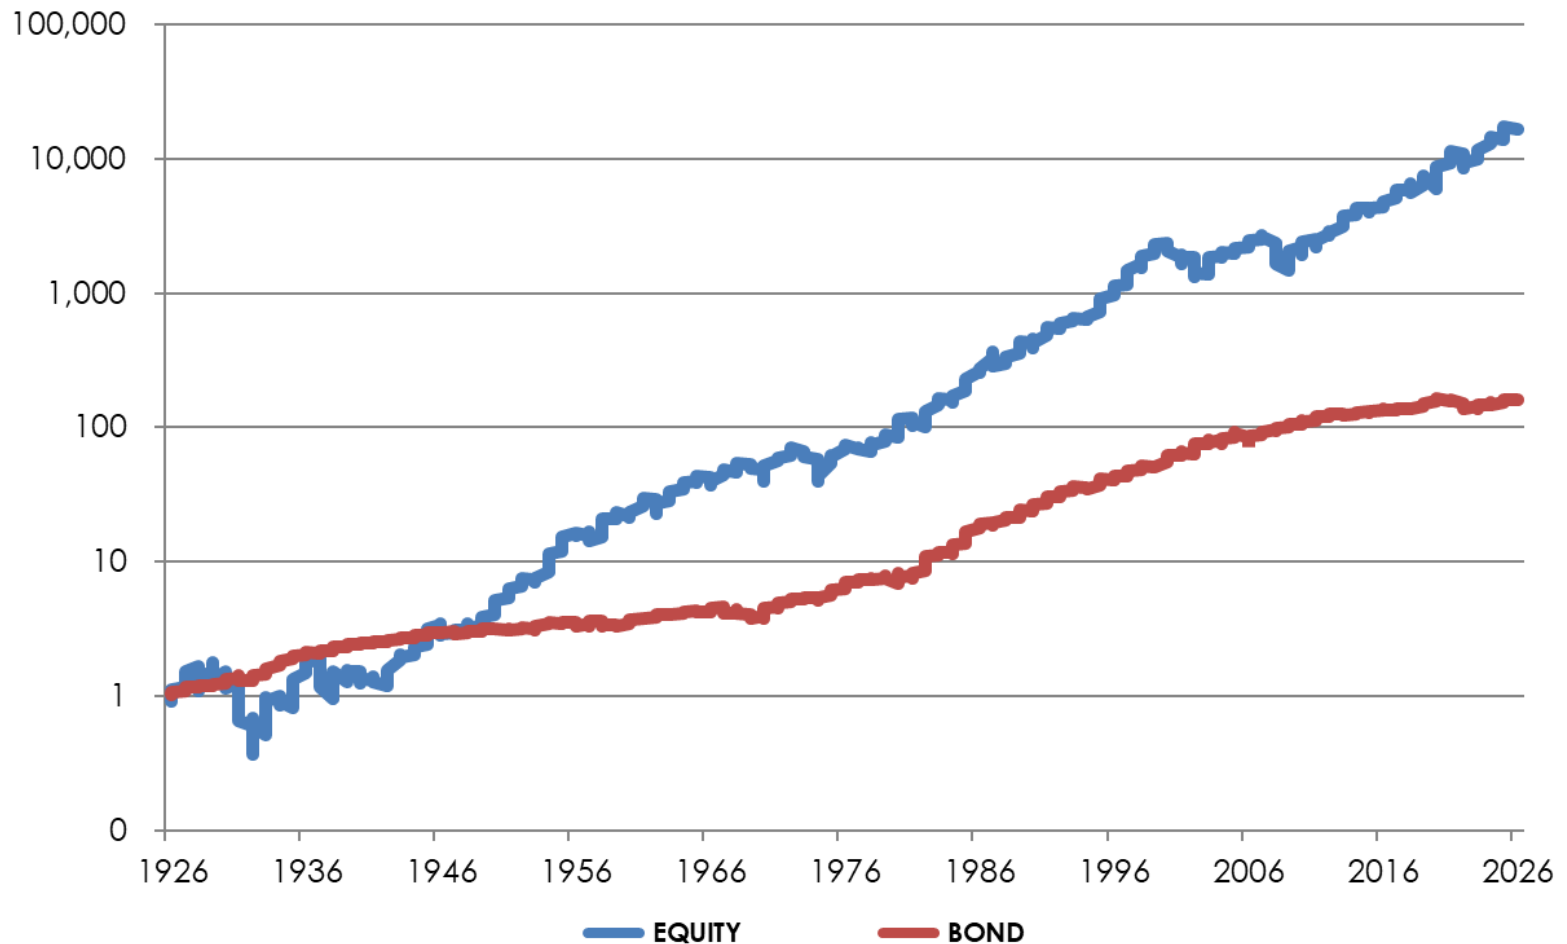

- Return and Risk Assessment
- Benchmark Recommendation
- Expected Return
- Valuation Analysis
- Asset Allocation Implementation

Return and Risk Assessment

Equity and Bonds

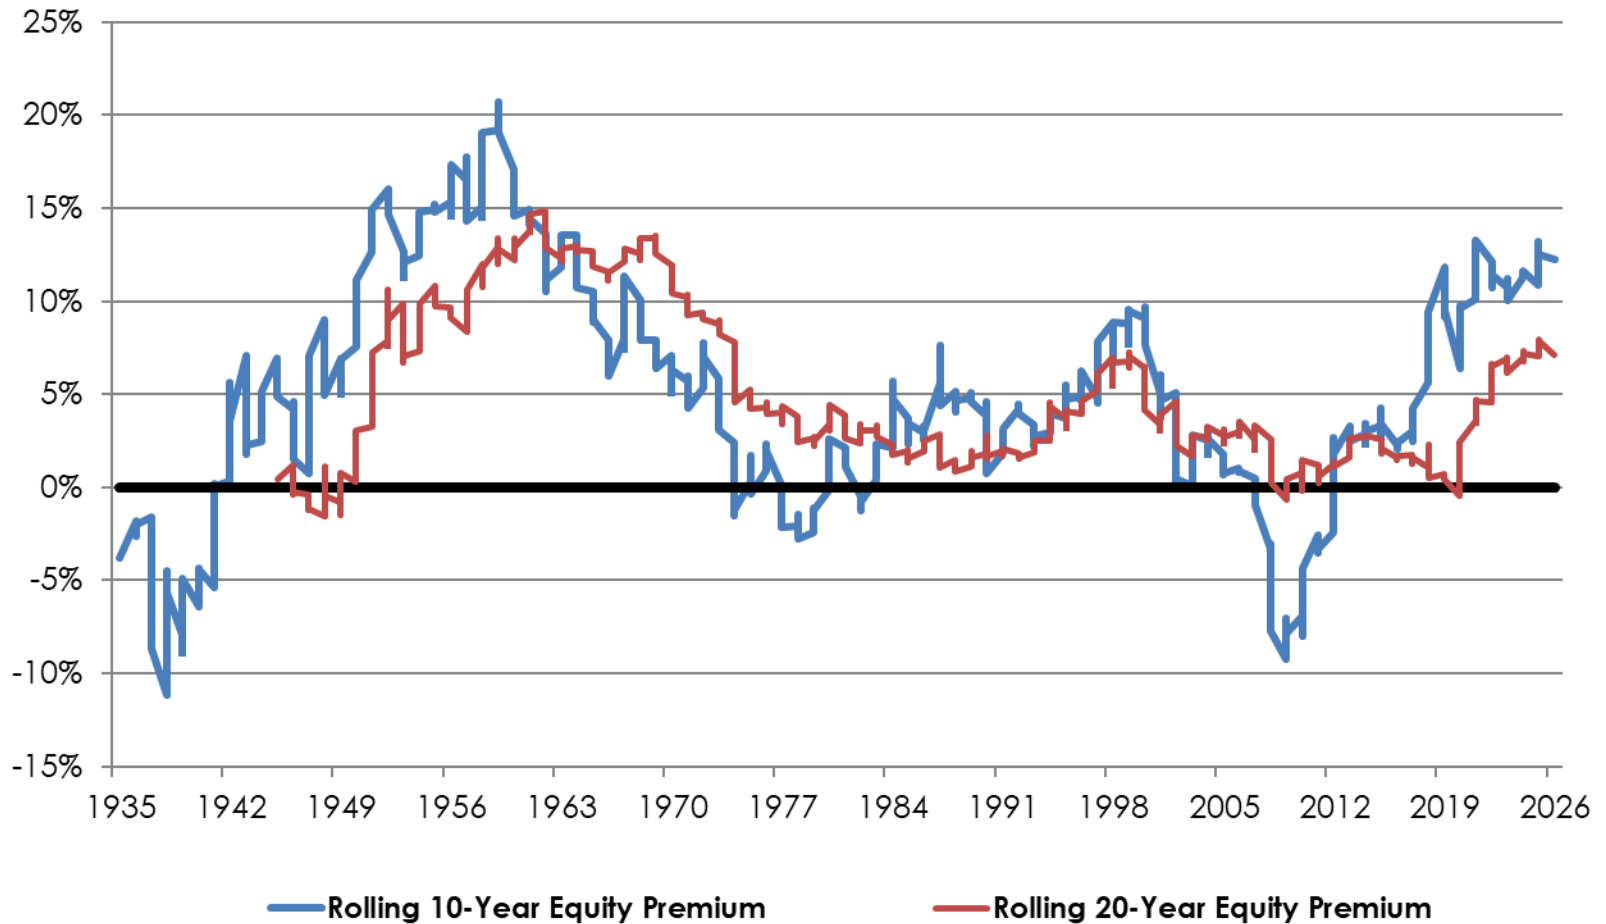

- Long-term return history is available only for equity, bonds, and cash
- Equity returns
 - Best over the very long term, but are volatile
- Bond returns
 - Lower over the long term compared to equities
 - Provide diversification
- Return/risk tradeoff depends on willingness to endure volatility

Long-Term Equity Returns Exceed Bond Returns

Equity Less Bond Return

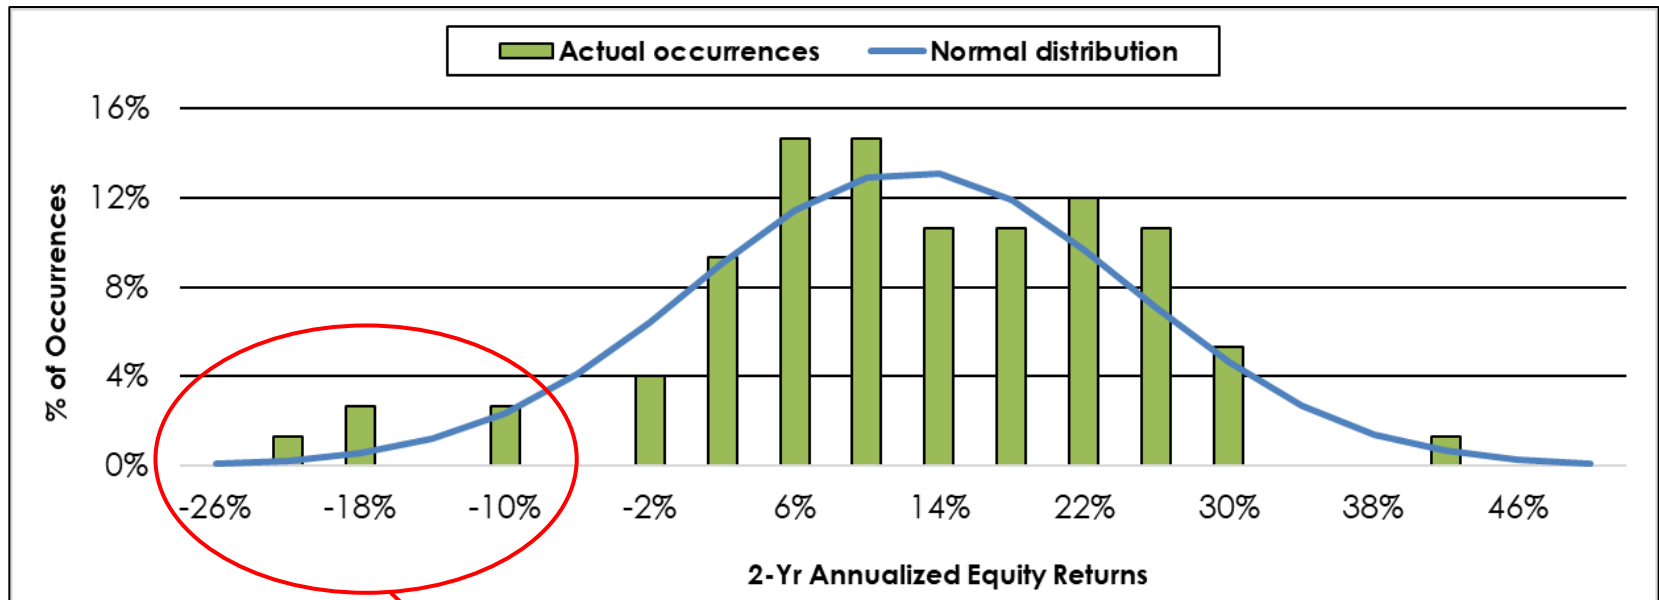

Historical Rolling Periods

Risk Measurement

Example: Actual vs Expected Equity Returns

- Conventional statistical measures of risk
 - Standard deviation and correlations are calculated

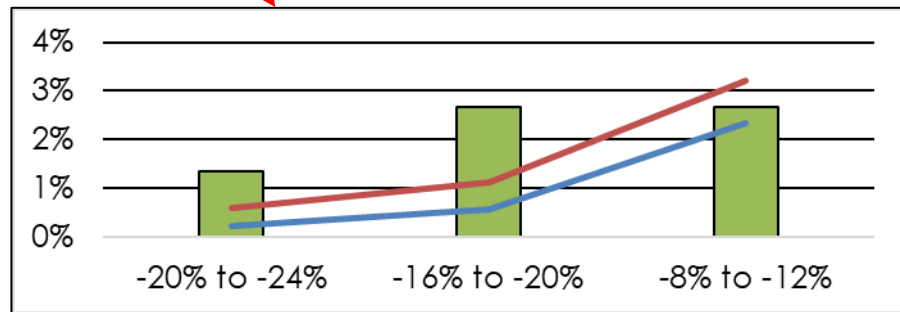

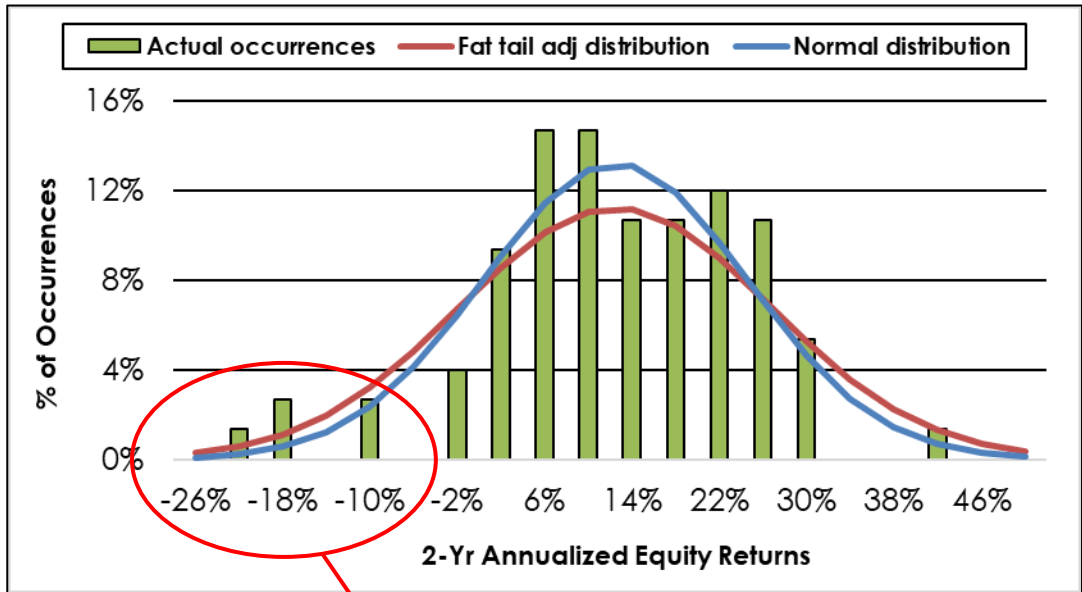

Risk is focused on severe adverse outcomes which are not represented well by conventional statistics

Risk Measurement

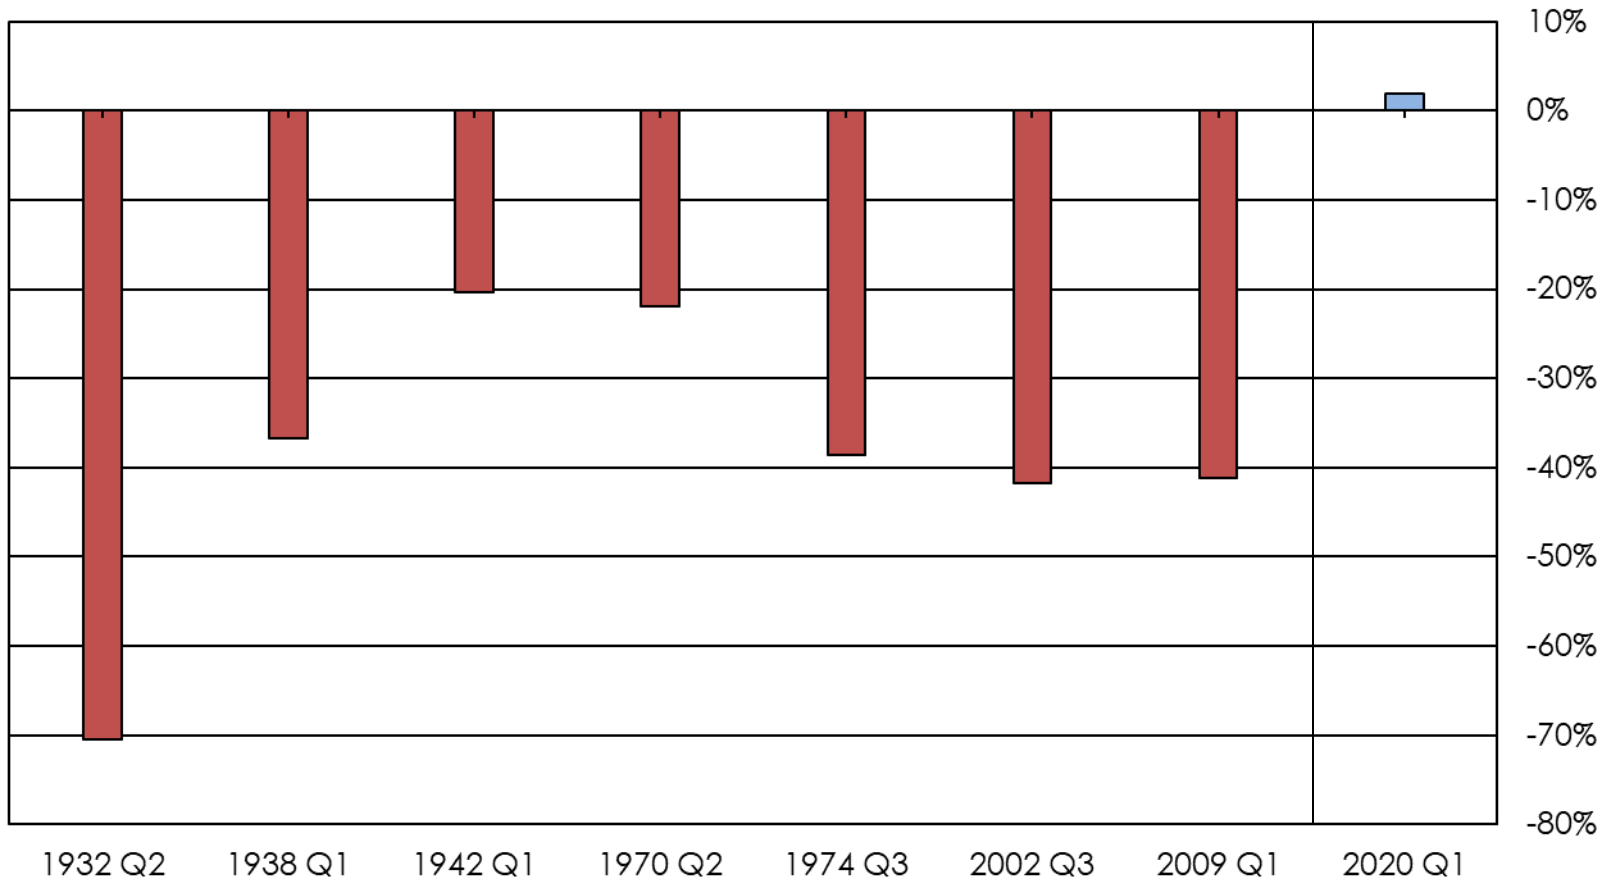

Example: Actual vs Expected Equity Returns

- SDIC adjustment to conventional risk measures
 - SDIC volatility
 - SDIC correlations
- Focus on equity-like and bond-like risk
 - Withstanding a two-year adverse outlier event

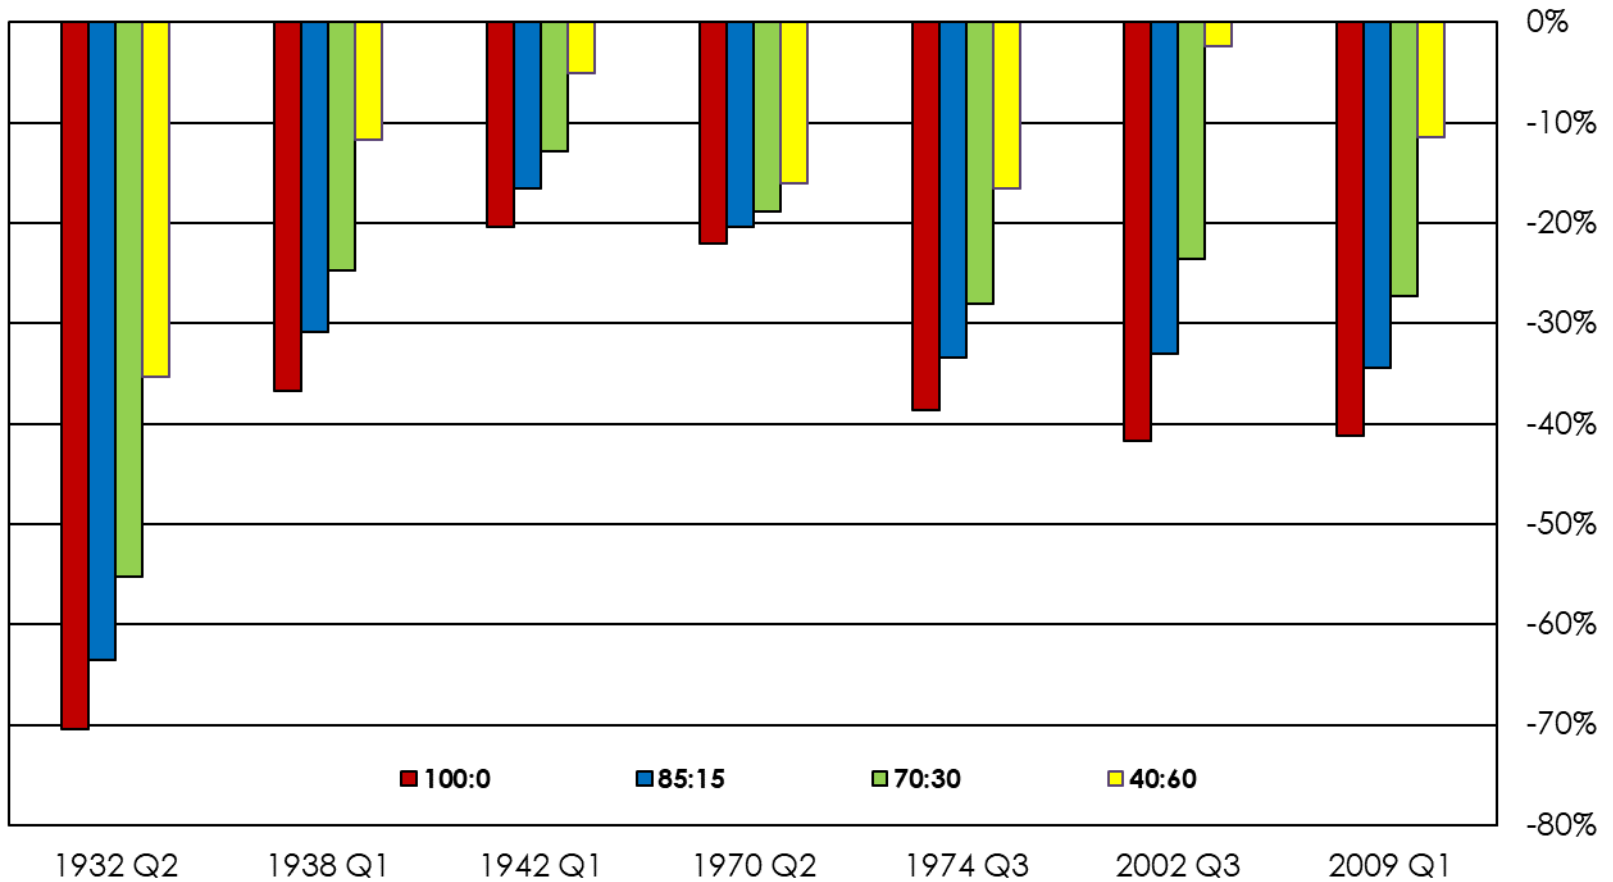

Equity Downturns Can Be Severe

Two-year periods with equity returns below negative 20%

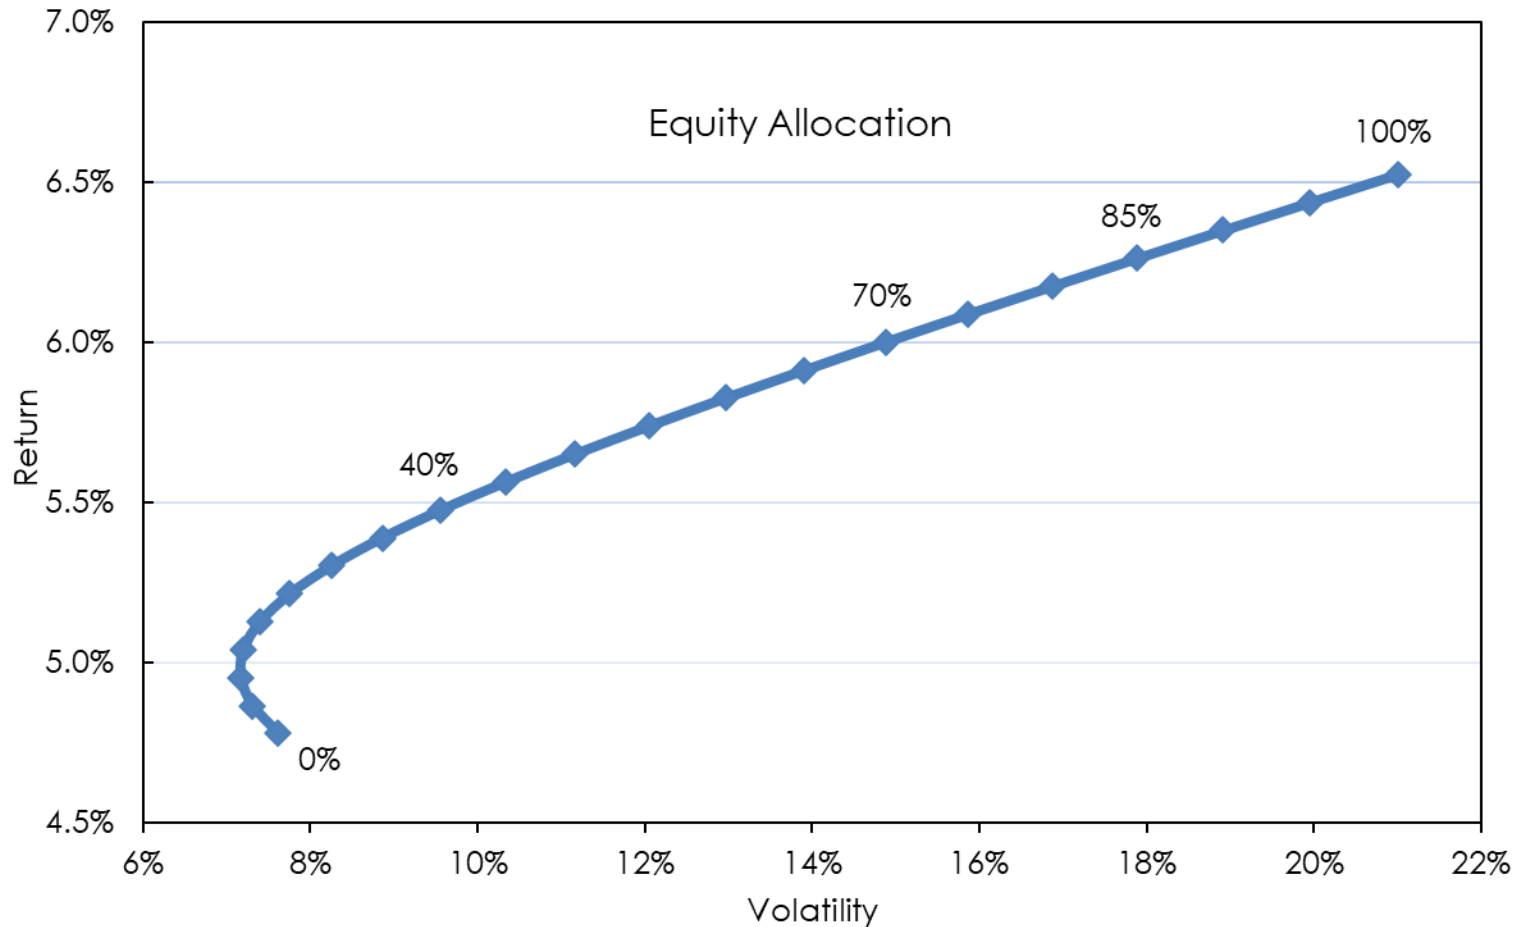

Risk of Various Equity Allocations

Two-year periods with equity returns below negative 20%

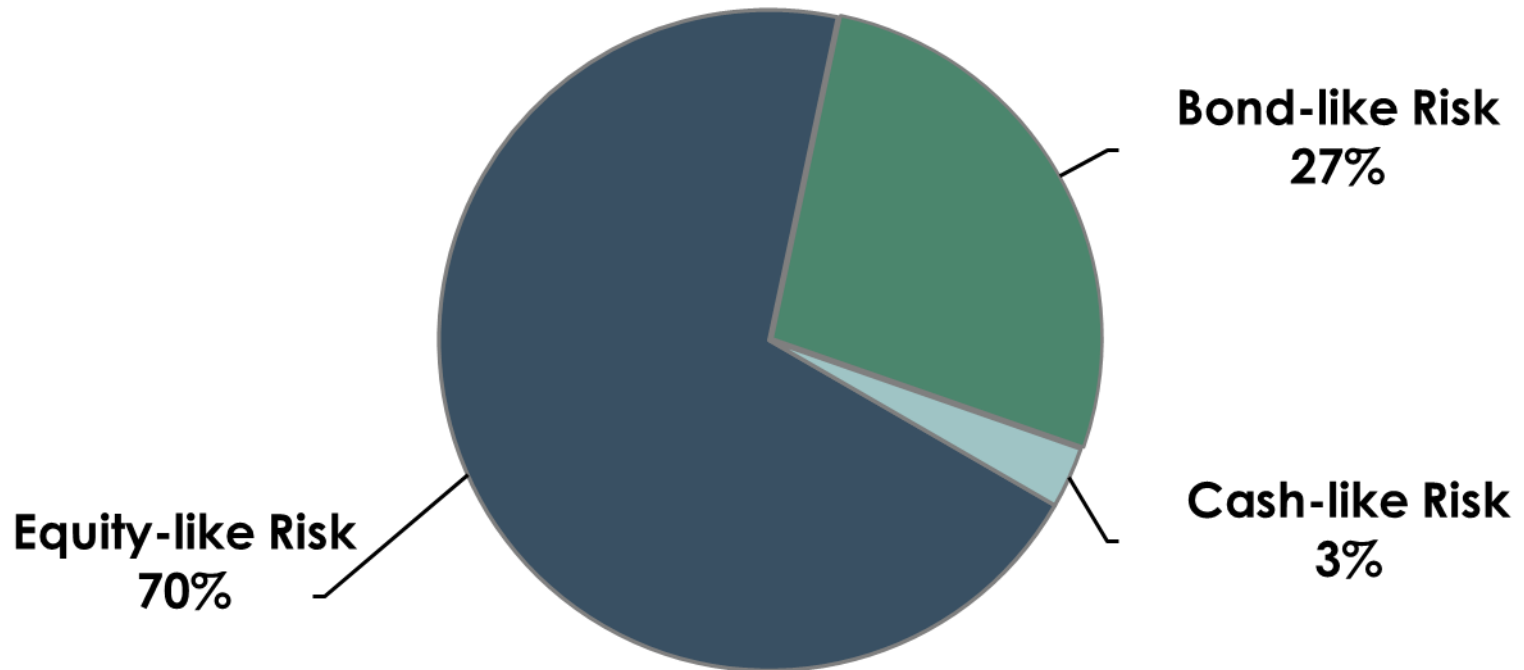

Return and Risk for Stock/Bond Allocations

Using SDIC long-term expected returns and fat tail adjusted volatility

Benchmark Recommendation

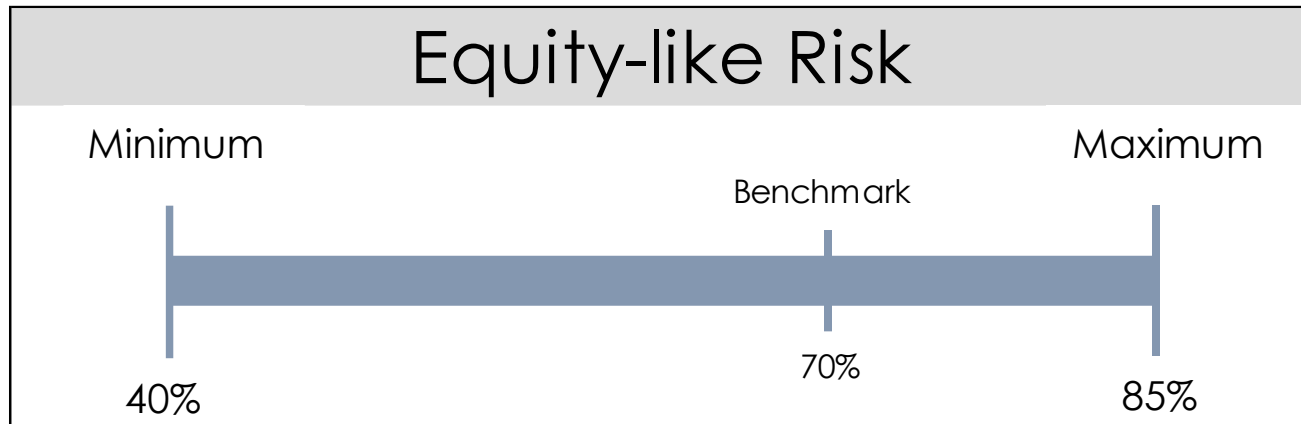

- Balances long-term returns and drawdown risk

Benchmark Ranges

- Goal
 - Enter market downturns with near minimum equity-like risk
 - Increase equity-like risk toward maximum during equity downturns to benefit from an eventual rebound
- The Importance of Patience
 - Markets typically continue to rise or fall further after reaching minimum or maximum risk thresholds
 - Essential to be patient for 5 years or more

Benchmark Range Recommendation

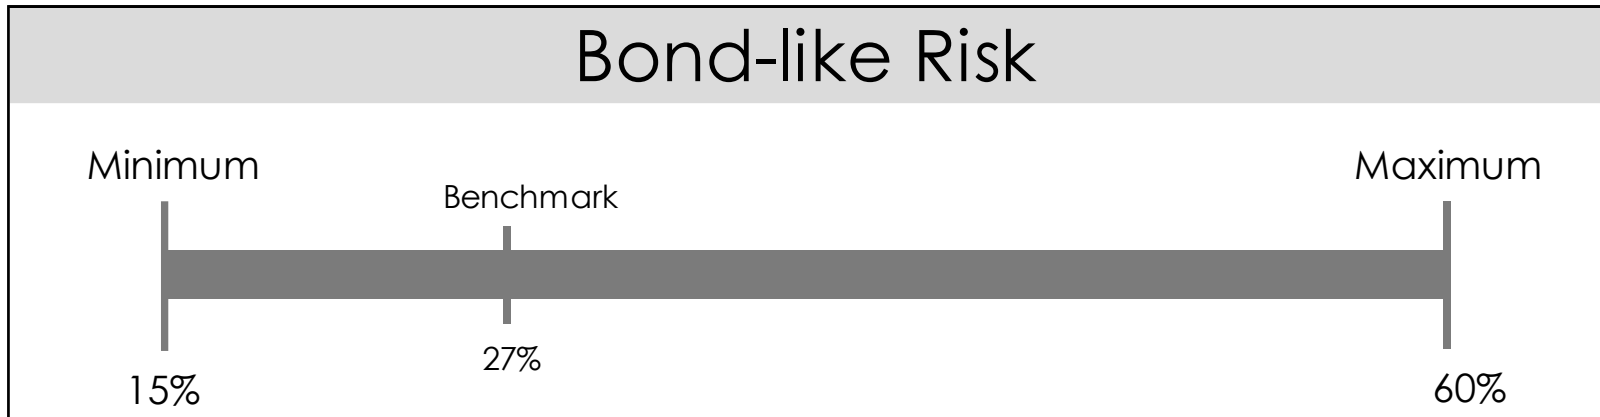

Minimum

- Increases underperformance risk but also reduces absolute risk when markets are extremely expensive
- Still provides meaningful exposure if wrong or early

Maximum

- For when markets are very cheap (on our valuation measures)
- Cheapness would suggest much of a potential decline had already occurred
- Weathered this maximum during the financial crisis

Benchmark Range Recommendation

Minimum

- Provides diversification

Maximum

- For when bonds are very cheap (on our valuation measures)

Risk of Other Asset Categories

- Other categories are mapped to equivalent equity-like / bond-like / cash-like risk
 - REITS mapped primarily to equity with remainder mapped to short duration bonds
 - High Yield Debt mapped to equity and short duration bonds depending on credit quality
 - Private Equity treated as leveraged equity
 - Opportunistic Real Estate treated as leveraged REITs
- Exposures embedded in other categories are accounted for when targeting overall equity-like / bond-like / cash-like risk

Benchmark Construction

- Categories in the benchmark are significant and passively implementable
 - Public Equity, Investment Grade Debt, Cash, High Yield Debt, REITs
- Secondary categories are excluded from the benchmark, but have permitted ranges
 - Private Equity, Opportunistic Real Estate, Hedge Funds
- Equivalent stock/bond/cash risk is accounted for and offset when investing in other asset categories
- Benchmark constructed to achieve 70% equity-like, 27% bond-like, and 3% cash-like risk exposures

SDRS Capital Markets Benchmark (CMB)

Proposed FY 27

	<u>Equity-Like Risk</u>	Primary Asset Categories					Secondary Asset Categories⁴			Other Categories⁵
		<u>Public Equity¹</u>	<u>Real Estate REIT/Core²</u>	<u>High Yield Debt</u>	<u>Investment Grade Debt¹</u>	<u>Cash³</u>	<u>Private Equity</u>	<u>Opportunistic Real Estate²</u>	<u>Hedge Funds</u>	
Minimum	40%	20%	0%	0%	13%	0%	0%	0%	0%	
Maximum	85%	75%	20%	15%	60%	45%	12%	15%	5%	5%
Proposed 2027 CMB	70%	56.3%	12%	7%	22.8%	1.9%				
Benchmark Index		(3/4) custom MSCI ACWI IMI ex Real Estate + (1/4) custom MSCI USA IMI ex Real Estate	MSCI US REIT	FTSE US High Yield Market	FTSE US BIG Bond	FTSE US 3-mo. Treasury Bill				
Benchmark History										
	2023-2026	56.3%	12%	7%	22.8%	1.9%				
	2016-2022	58%	10%	7%	23%	2%				

1. Buffer for market drift of 1% for public equity and 1/2% for debt (example: Investment Grade debt minimum of 13% can drift to 12.5%)

2. Real Estate(RE) min/max applies to REITS/Core RE and Opportunistic combined. Opportunistic RE counts 1.3x against RE max. Projected base case allocation used for partnerships

3. Cash to provide liquidity for benefits payments and rebalancing

4. Since 2015, secondary asset categories have not been included in the CMB. This change allowed the CMB to consist solely of well fitting, investable indexes.

These categories continue to have a permitted range to invest in opportunistically.

5. Other categories, such as TIPS, commodities, and arbitrage have been considered or used in the past. They are not in the CMB. Future use would be limited to 5% or less.

SDRS Return and Volatility Analysis

Using JP Morgan Inputs

	Expected Return	Standard Deviation*	Correlation Matrix

add REITs						12%			5.97%	14.98%
add High Yield Debt					7%				5.97%	14.97%
Proposed Benchmark FY27**	56.3%	0.0%	22.8%	1.9%	7.0%	12.0%	0.0%	0.0%	5.97%	14.97%
Actual Asset Allocation**	20.6%	1.1%	12.9%	39.7%	4.1%	0.0%	9.7%	11.9%	5.12%	10.55%

* Standard deviation is a measure of volatility. There is a 68% chance of being within +/-1 standard deviation and a 95% chance of being within +/-2 standard deviations. This measure has been adjusted to better reflect frequency and magnitude of adverse events.

** As of 3/31/26 (Estimate)

SDRS Return and Volatility Analysis

Using South Dakota Inputs

SDRS Expected Long-Term Return Recap

- Benchmark asset allocation expected return is 5.97%
 - Uses SDRS inflation assumption which can vary from SDIC inflation assumption
 - Does not incorporate any negative dollar cost averaging effect nor added value from the long-term contrarian investment approach
- Expected returns are the midpoint of a wide distribution with a 50% chance of being higher and a 50% chance of being lower
- Standard deviation is 15.0% and is adjusted to reflect real-world frequency of severe negative returns and correlations during severe periods
 - Conventionally measured standard deviation is ~12%

Risk Control Summary

- Risk control
 - Risk managed by broad diversification and reducing amounts in expensive assets
 - Adequate liquidity maintained to avoid liquidations of depressed assets and to allow rebalancing
- Strength and determination to handle tough markets
 - Participation in the free enterprise economic system provides highest long-term rewards but must endure short-term bumps in the road
- Strong funding and benefit design help manage downside volatility
 - In very difficult circumstances, benefits may require further adjustment to maintain funding

Asset Category Valuation

- Equity-like and bond-like risk
 - Equity and bond valuation processes
- Real estate (REITS)
 - REIT valuation versus underlying equity and bond components
- High yield debt
 - High yield valuation versus underlying equity and bond components
- Private equity
 - Subjective and data assessment of risk-adjusted added value versus equity
- Opportunistic real estate
 - Subjective and data assessment of risk-adjusted added value versus REITS
- Arbitrage and other strategies
 - Monitor for signs of distress and bottom-up underwriting of proxy transactions

Equity Valuation

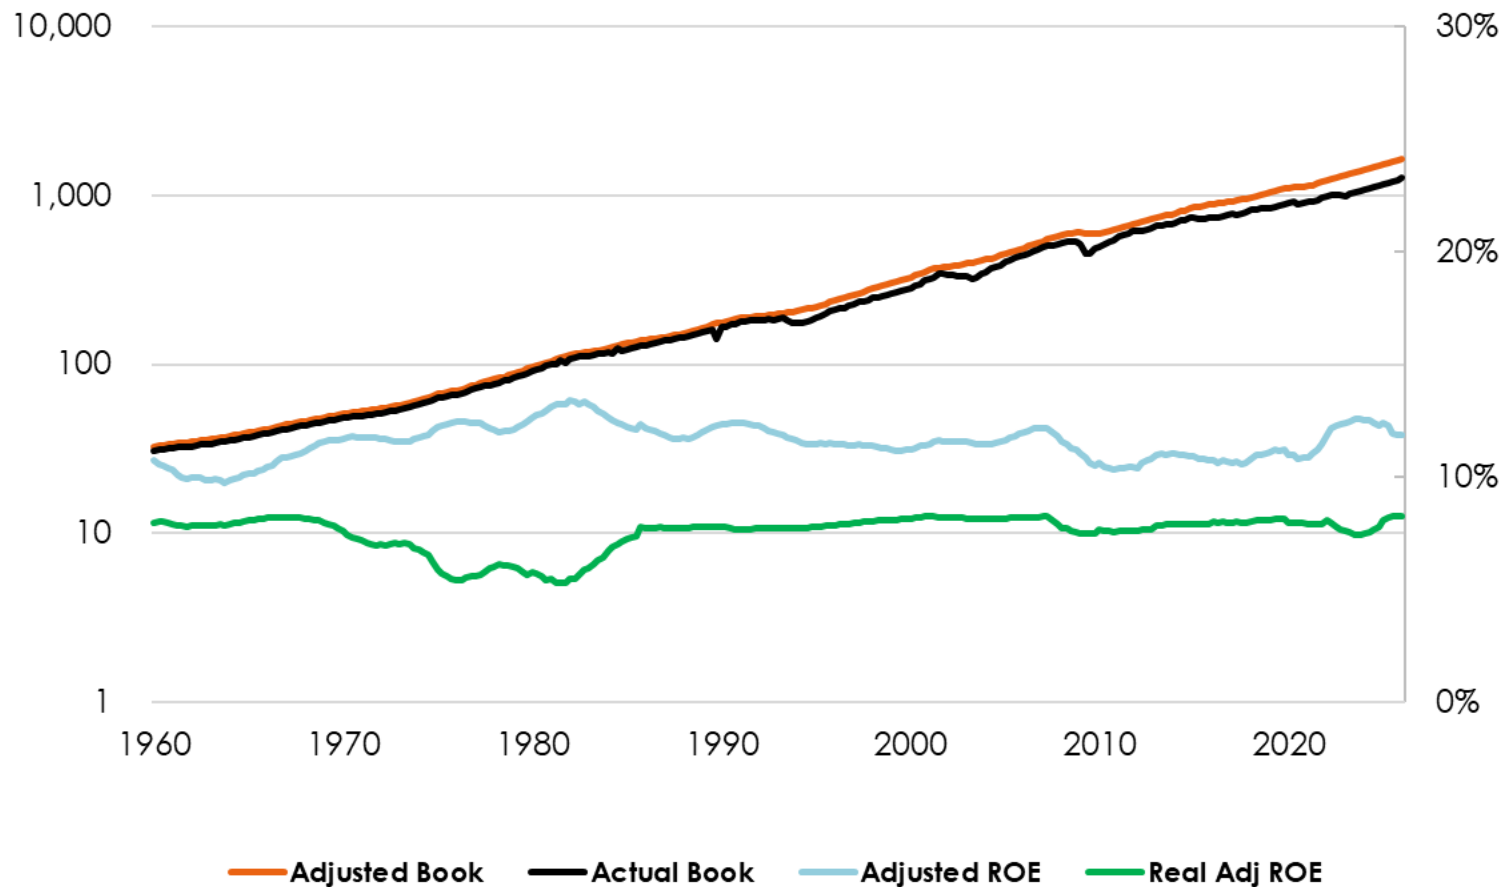

- Estimated future cash flows
 - Normal earnings
 - Growth rate
- Discount rate comprised of
 - Inflation + real T-bill yield + term premium + risk premium
- Value is discounted value of future cash flows
- Adjustments to value
 - Monetary stimulus/restraint
 - Earnings strength

Normal Earnings

- Normal earnings
 - Adjusted book value multiplied by normal return on equity
- Adjusted book value
 - Book value is the balance sheet reported value of assets net of liabilities
 - Book value may not track earnings minus dividends due to index changes, mergers, and buybacks. These leakages must be addressed.
 - Write-downs and extraordinary items are smoothed
- Normal return on equity = Historic Real ROE + Expected Inflation + ROE Adjustments
 - Return on equity is earnings divided by adjusted book value
 - Real ROE is return on equity less inflation
 - Historic Real ROE is the historic average Real ROE
 - Expected inflation is drawn from long term and recent history
- ROE Adjustments
 - Inflation can impact the level of real ROE
 - Governance can also impact real ROE

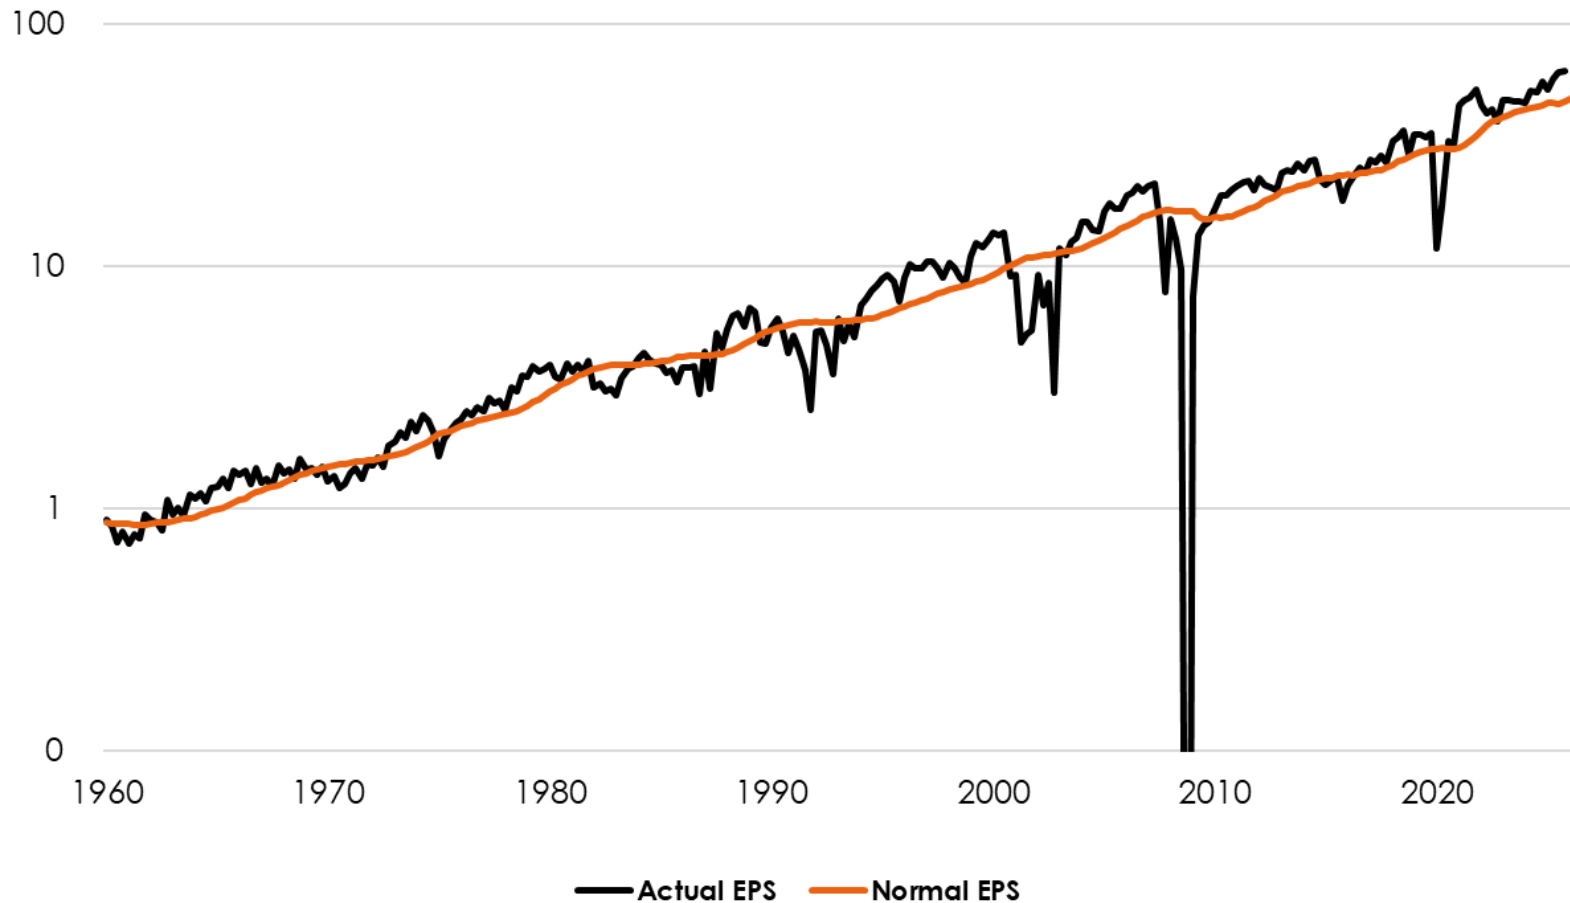

Book Value and Return on Equity

Incorporates book value adjustments

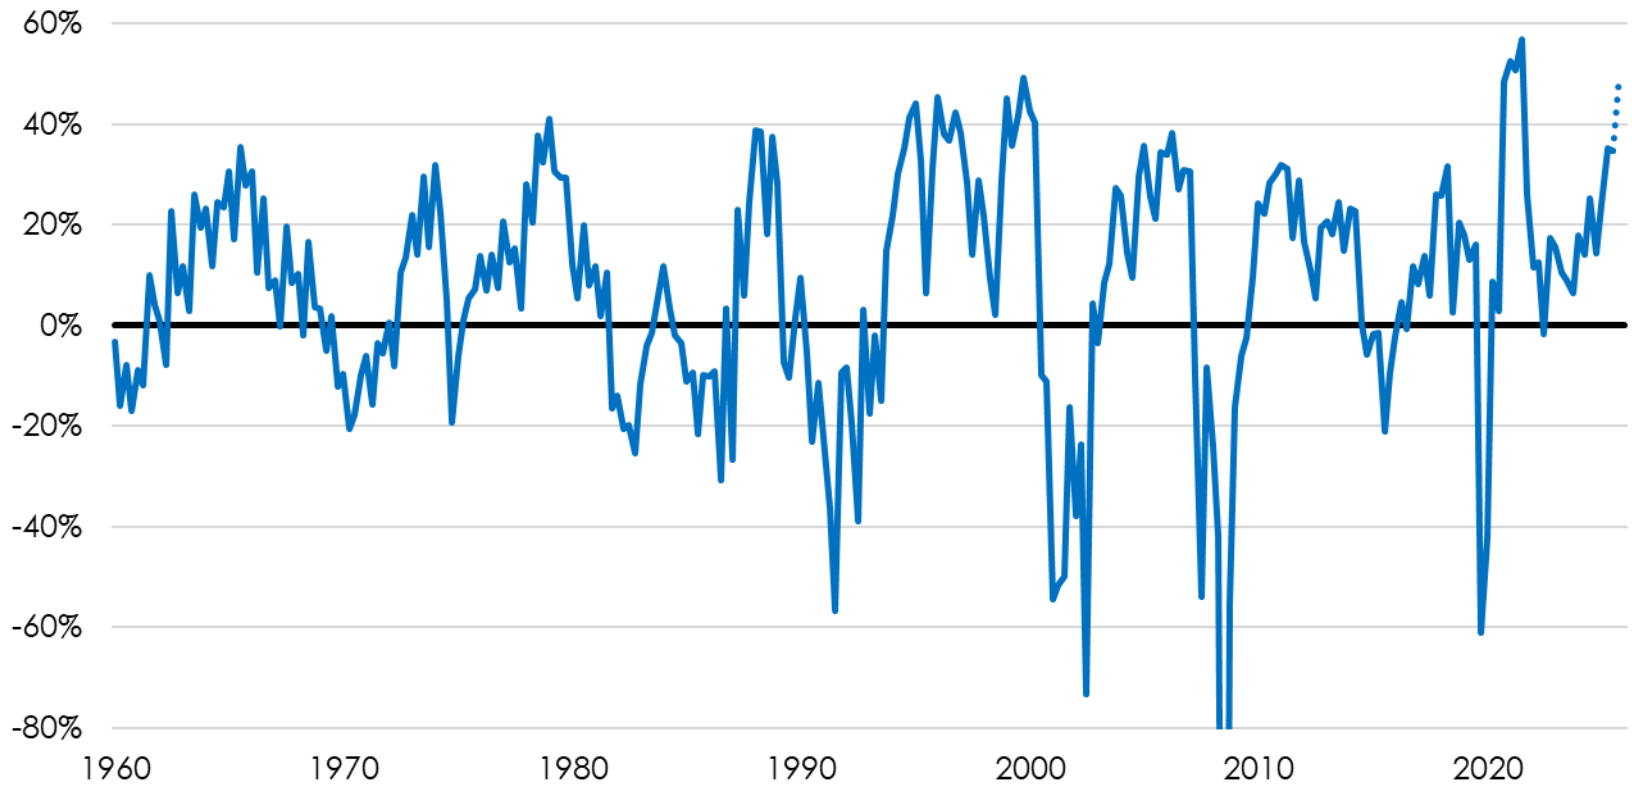

Normal EPS

Book value multiplied by adjusted ROE (log scale)

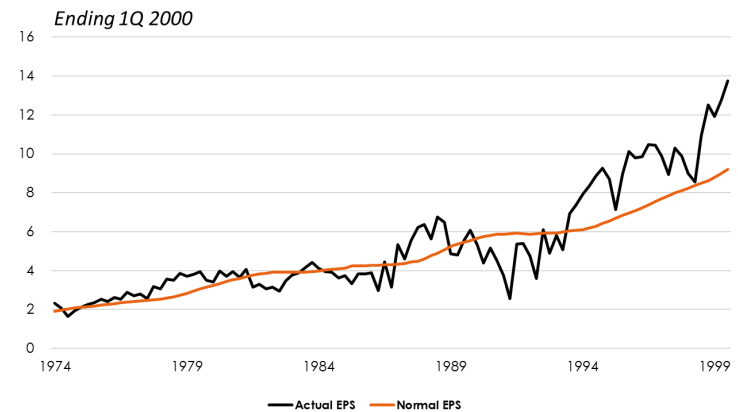

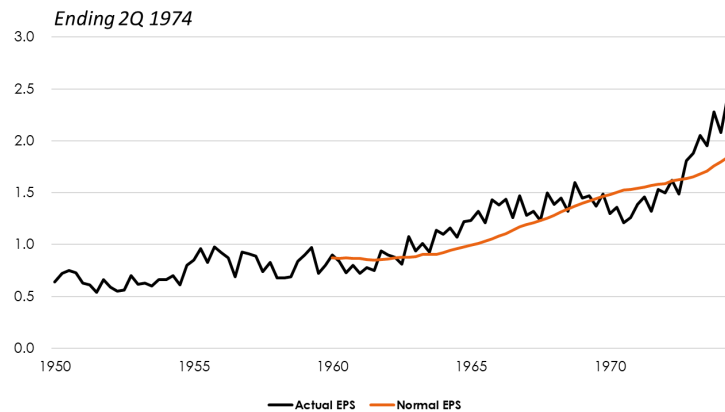

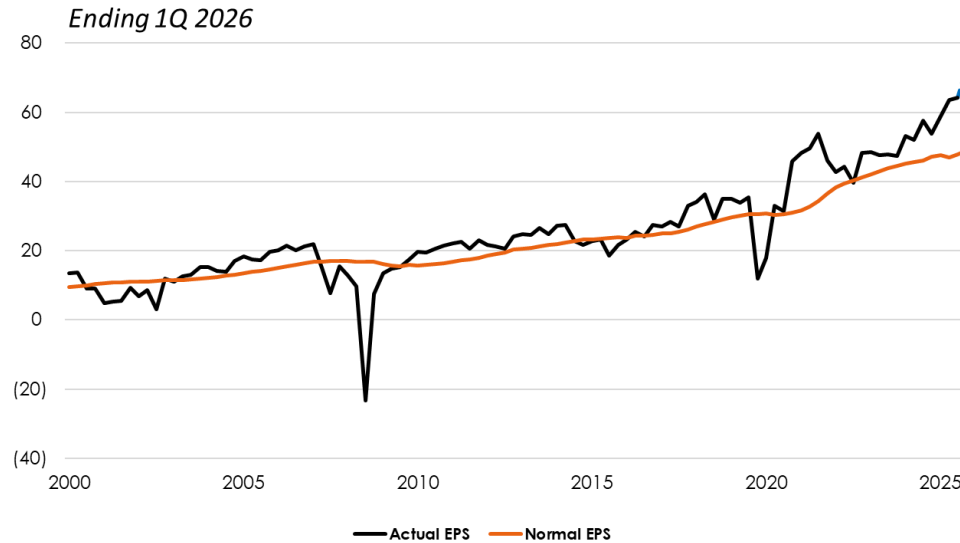

Actual EPS

Percentage Above or Below Normal

Normal vs Actual Earnings Examples

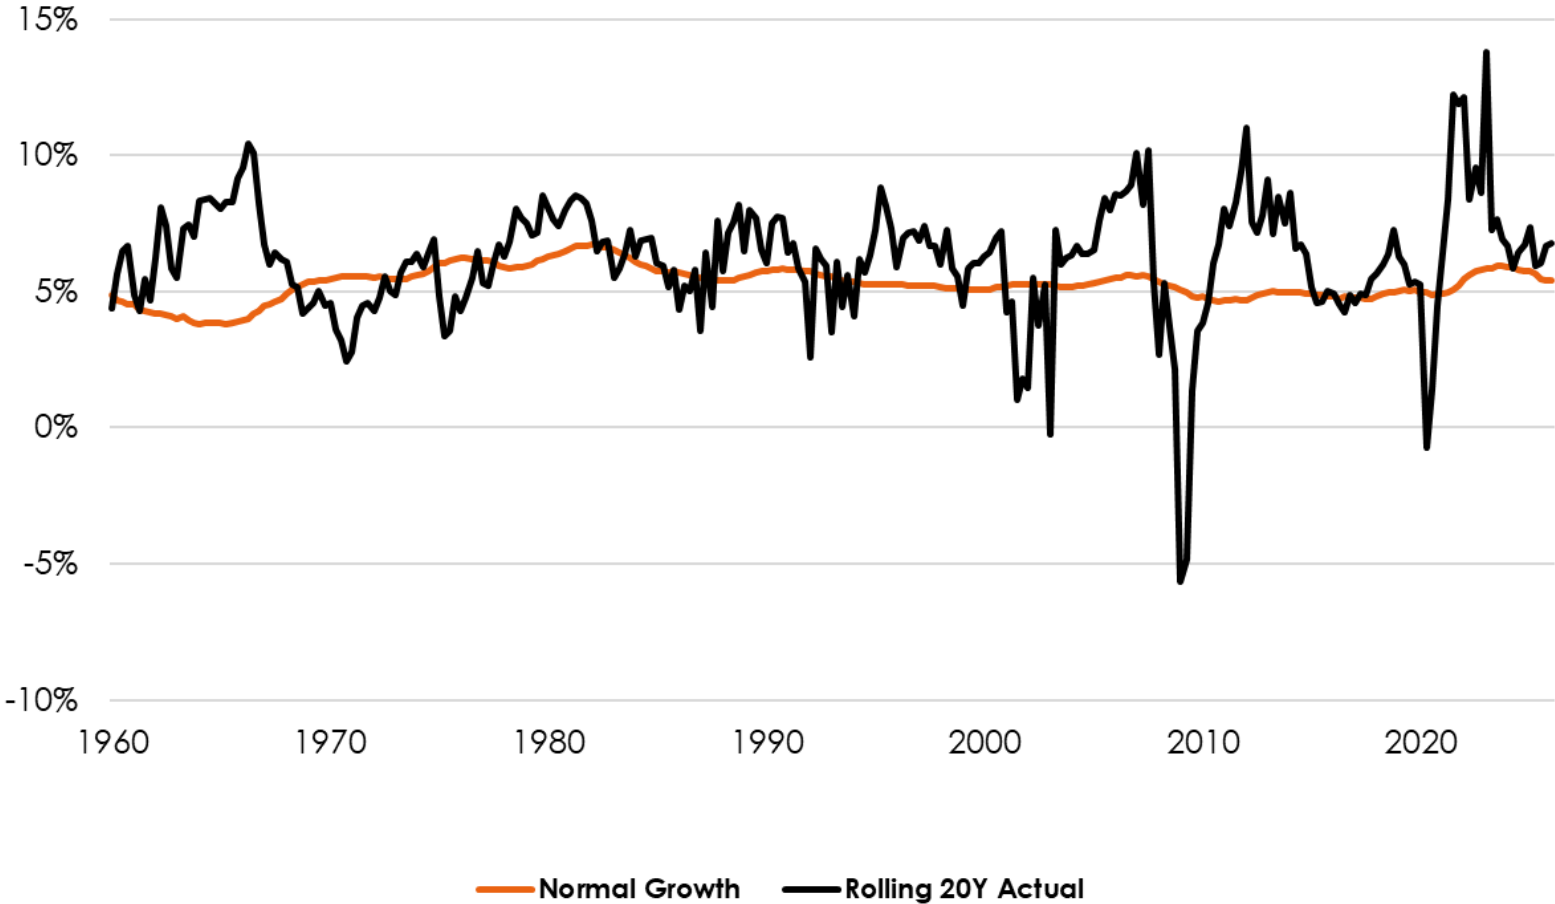

The information presented is to be used solely for management of State of South Dakota financial assets. Any others should conduct their own research and consider their own circumstances.

Normal Growth

- Normal Growth = organic + acquisition + inflation pass-through – attrition
 - Organic growth = organic reinvestment times normal ROE
 - ▶ Organic reinvestment = portion of earnings reinvested excluding acquisitions
 - ▶ Normal ROE adjusted to avoid double counting of inflation pass-through effect
 - Acquisition growth = acquisition investment times cost of capital
 - ▶ Acquisition investment = portion of earnings invested in acquisitions
 - ▶ Return of acquisitions based on cost of capital
 - Inflation pass-through = expected inflation × pass-through percentage
 - ▶ Expected Inflation = same as used for Normal ROE
 - ▶ Pass-through percentage = percent of expected inflation estimated to pass through as an increase in normal earnings
 - Attrition = estimated mortality rate of normal earnings
 - ▶ Adjust for bias of earnings power (absent further investment) to be at risk of erosion
 - ▶ Attrition rate helps reconcile historic actual growth with the growth otherwise expected

EPS Growth

Normal versus 20-year actual

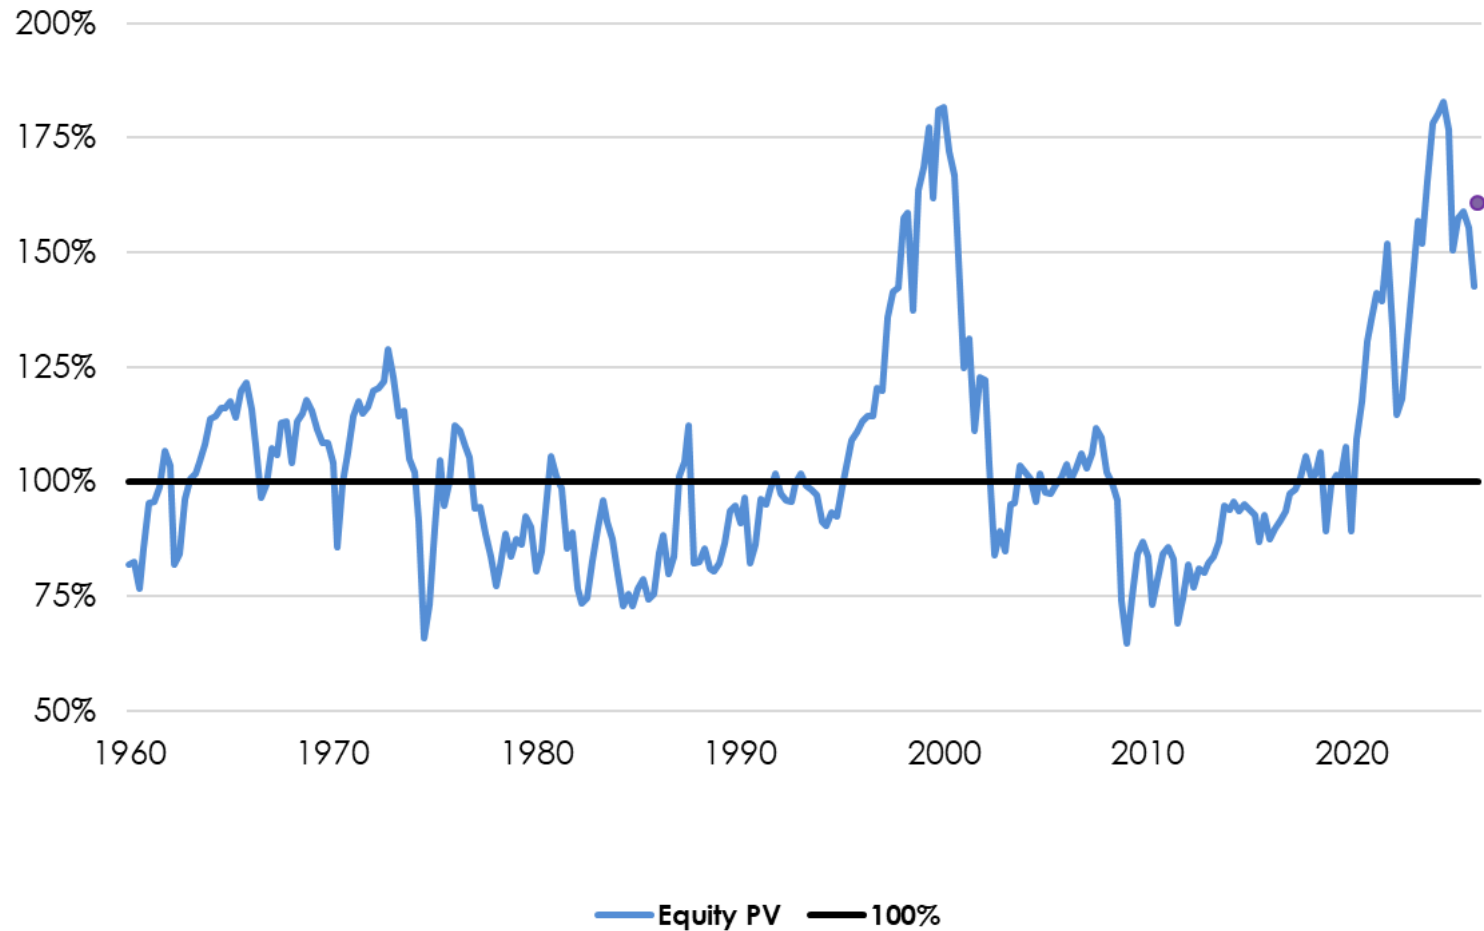

Discount Rate

Discount rate used for valuation is comprised of the following normalized components:

- Real T-bill yield based on real GDP growth and inflation tax adjustment
- Expected inflation
- T-bill to 10-year term premium
- 10-year to 30-year term premium
- Equity risk premium

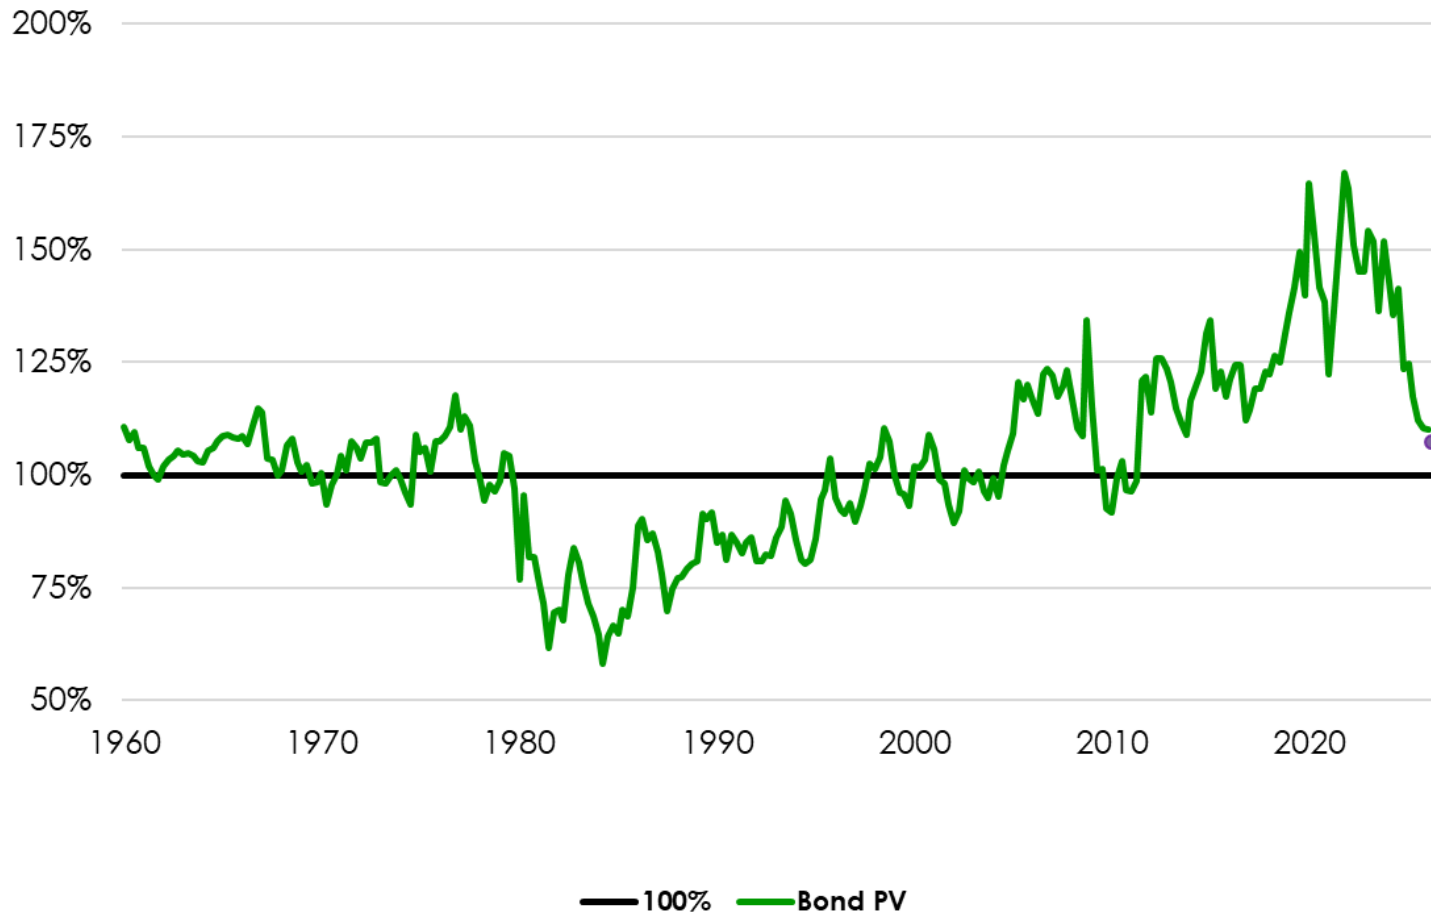

Equity Price to Value

Bond Valuation

- Equilibrium yield components include
 - Inflation
 - Real T-bill yield
 - Term premium
- Bond value based on equilibrium yield
- Adjustments to value
 - Monetary stimulus/restraint
 - Earnings strength

Bond Price to Value

Real Estate Valuation

- Real estate capitalization rate is adjusted to a typical equity/debt structure
- Discount rate is linked to the equity discount rate
- Difference between leverage-adjusted cap rate and discount rate is converted into price to value

High Yield Spread Model

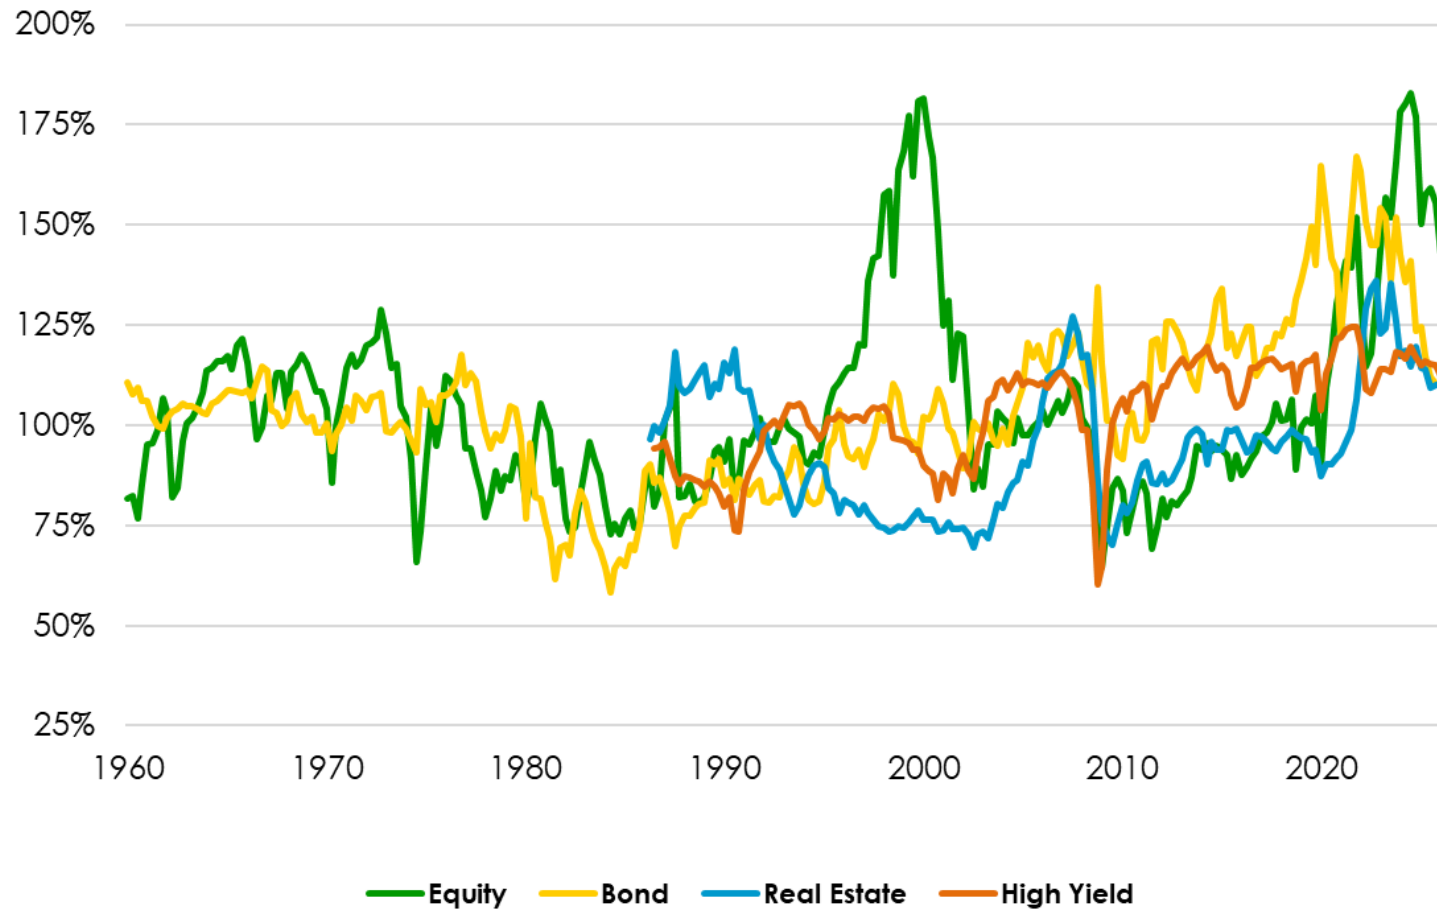

- Fair spread to treasuries based on long-term average spread and internal credit modeling research
- Difference between current spread and fair spread is converted into price to value

High Yield Valuation Model

- Fair yield
 - Fair yield of similar duration treasuries plus
 - Fair yield spread to treasuries
- Current yield is compared to fair yield
- Yield difference is converted to price to value

Price to Value

Equity, Bond, Real Estate, High Yield

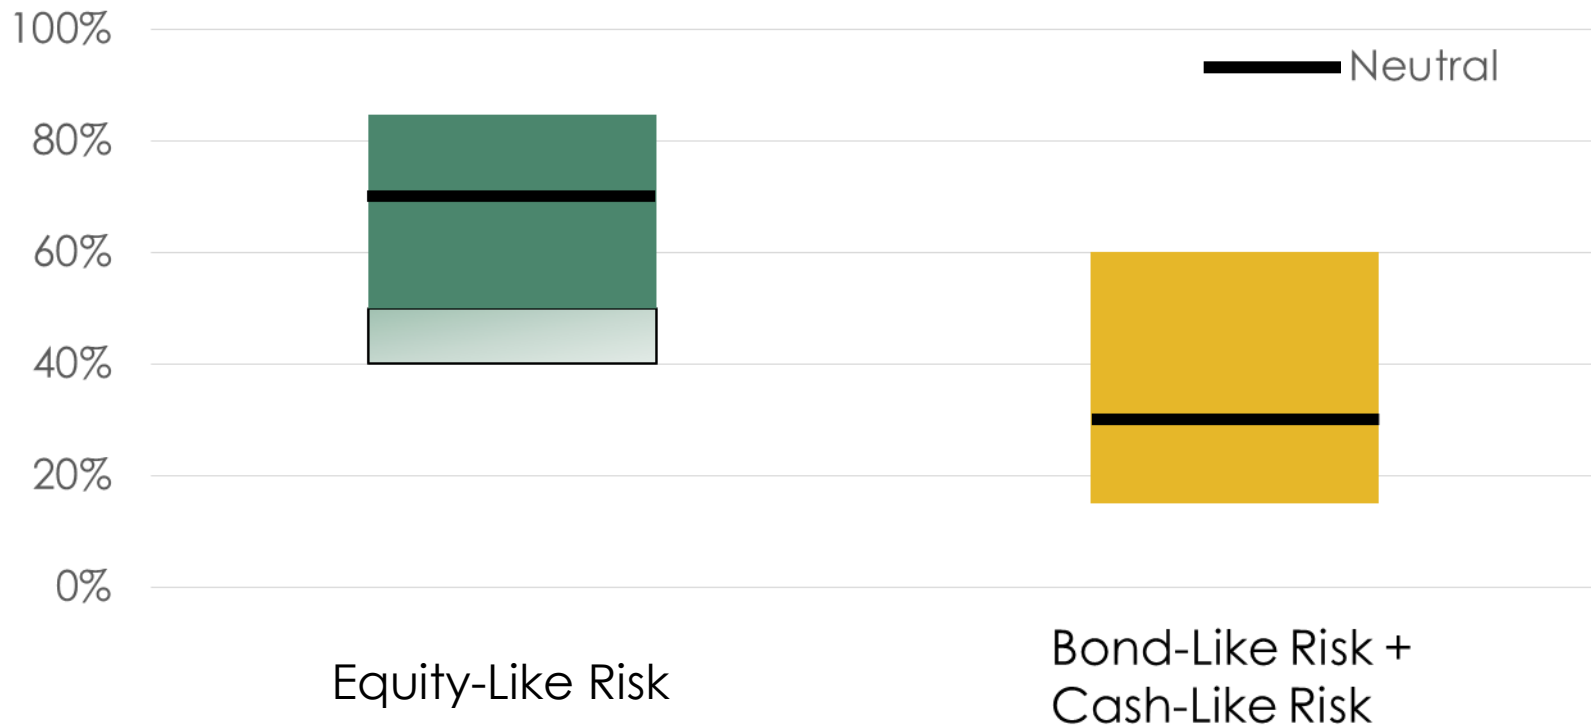

— Equity — Bond — Real Estate — High Yield

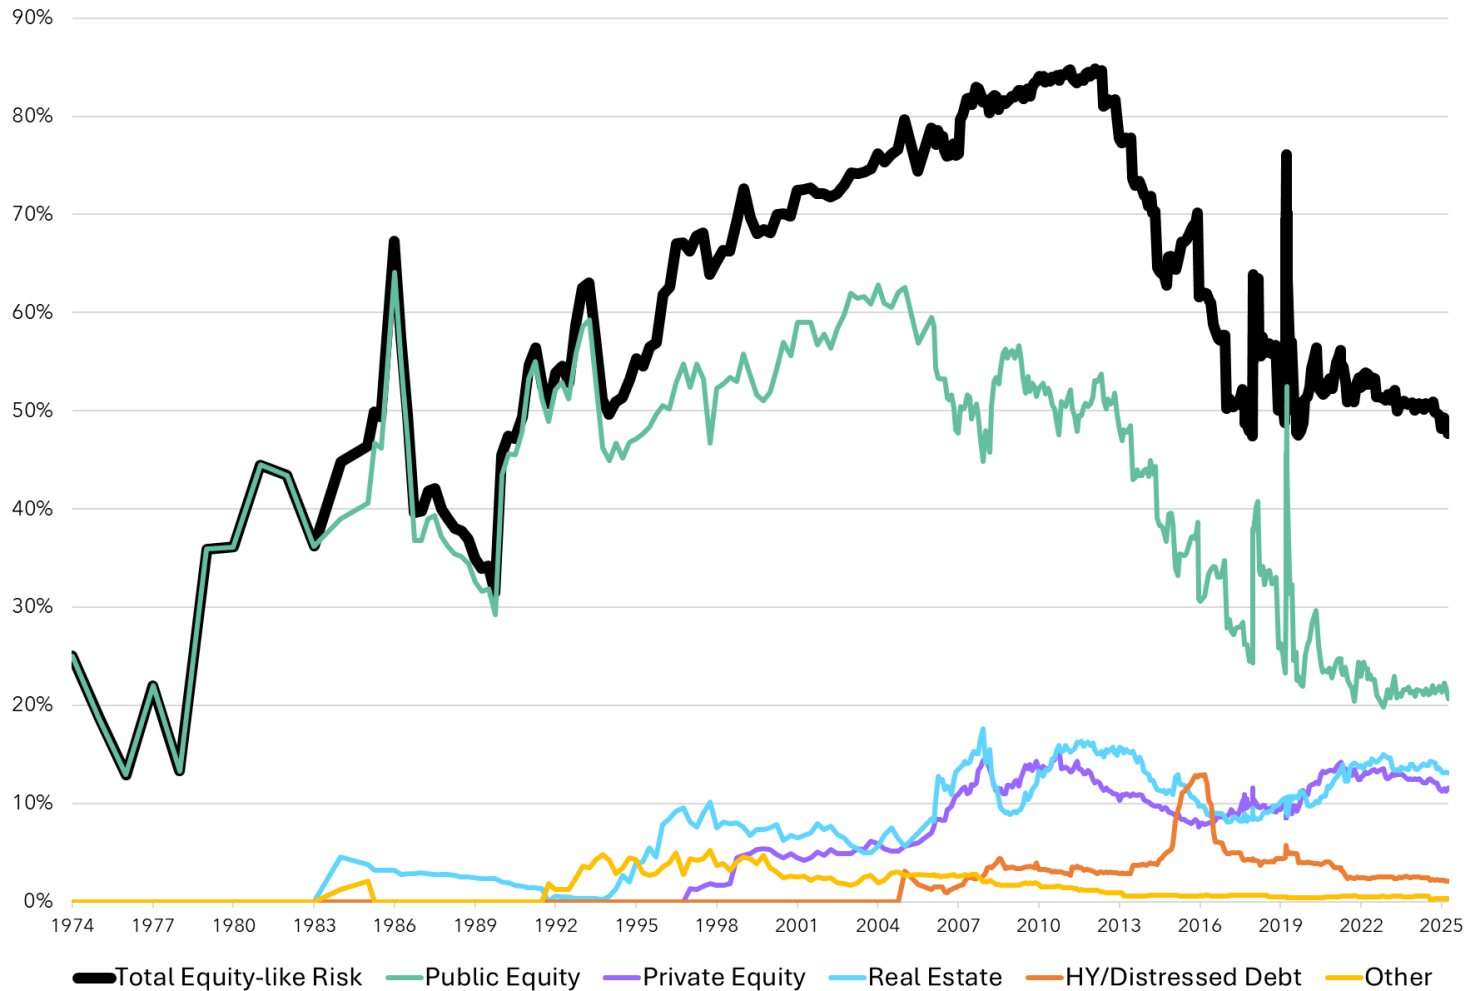

Asset Allocation Implementation

- Equity-like and bond-like risk
 - Meaningfully cheap or expensive to initiate over- or under-weight
 - Move back toward fair value to remove over- or under-weight
 - Several steps between the benchmark and minimum and maximum levels
- Other category over- and under-weights depend on valuation relative to risk mapping
 - Equity-like, bond-like, and cash-like risk is offset by adjusting weight of stocks, bonds, or cash

Risk Allocation Ranges

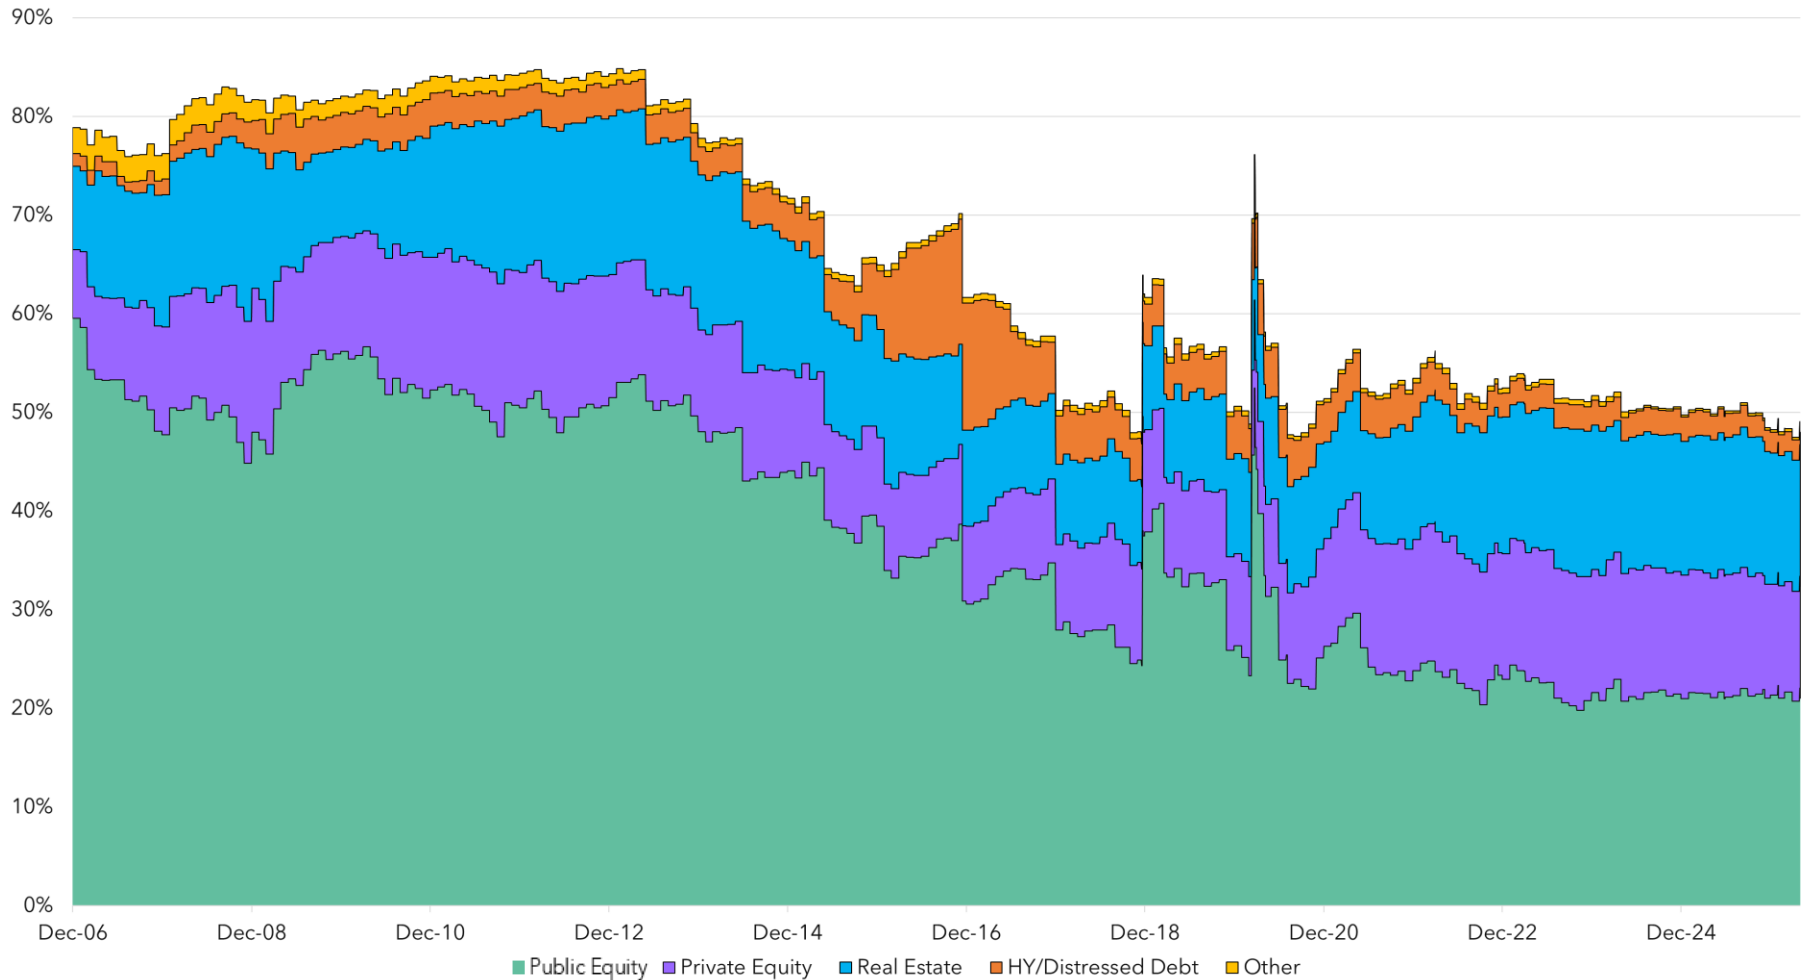

Equity-Like Risk Contribution

The information presented is to be used solely for management of State of South Dakota financial assets. Any others should conduct their own research and consider their own circumstances.

Equity-Like Risk Contribution

■ Public Equity ■ Private Equity ■ Real Estate ■ HY/Distressed Debt ■ Other

The information presented is to be used solely for management of State of South Dakota financial assets. Any others should conduct their own research and consider their own circumstances.

25-Mar-20	2475.56		2100	2600
26-Mar-20	2630.07	Decreased	2200	2700
27-Mar-20	2541.47		2200	2700

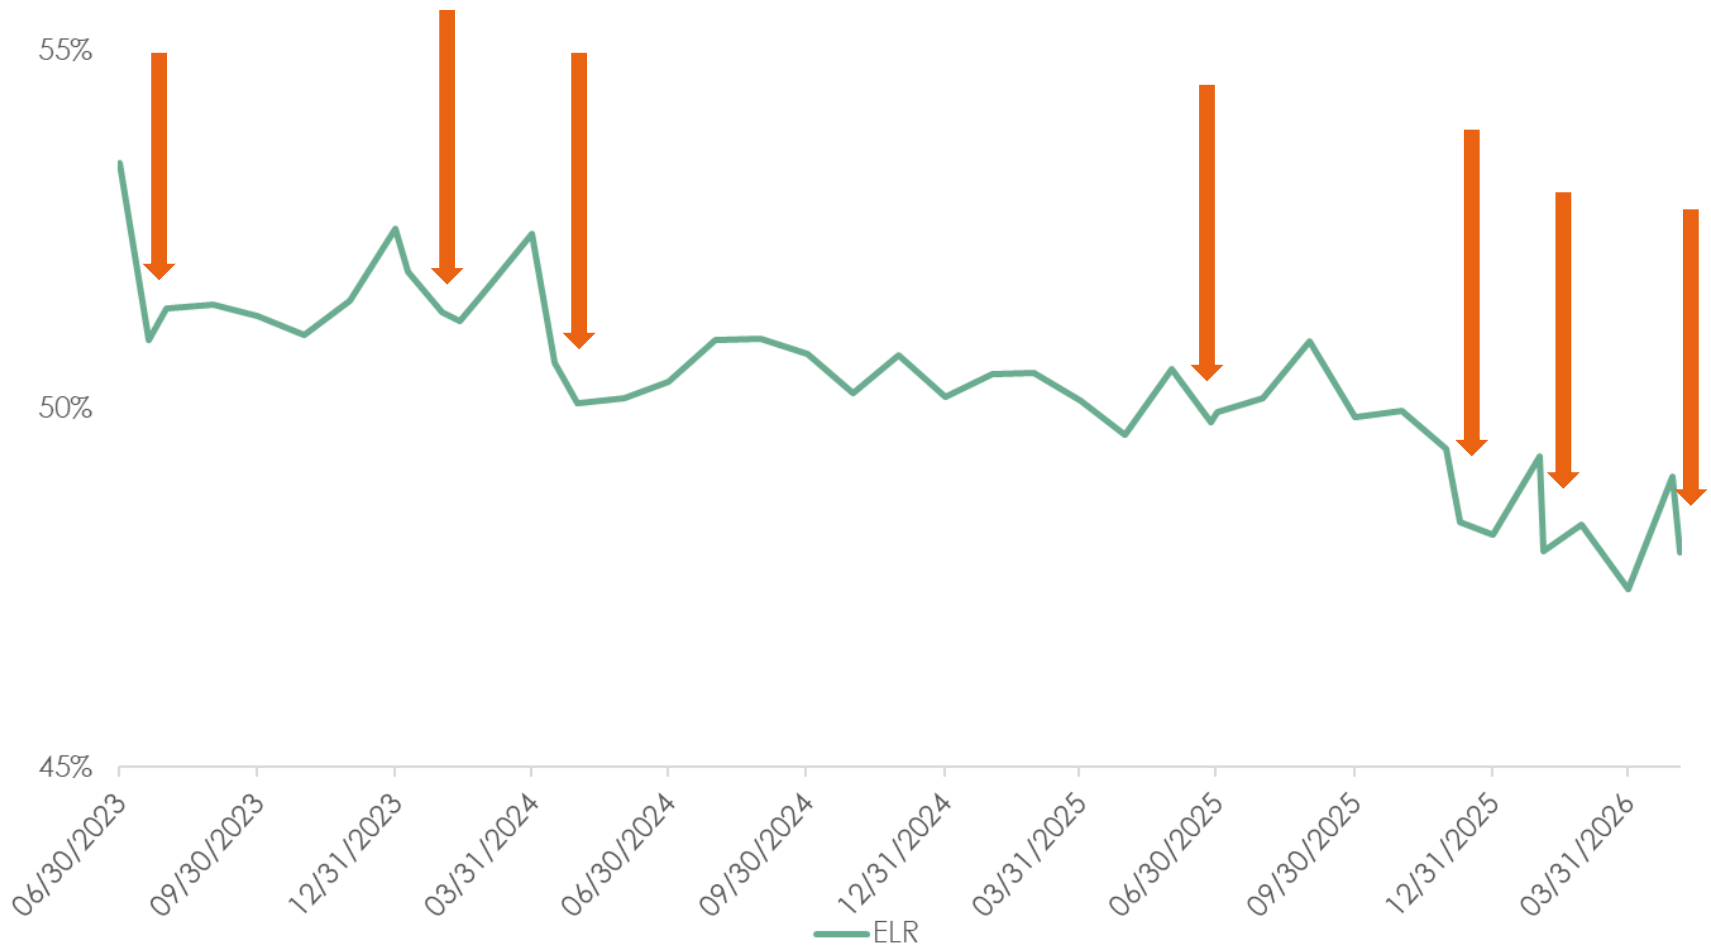

Model Suggested Equity-Like Risk

3/1/2020 through 8/15/2020

Implementation

SDRS Equity-Like Risk Adjustments

Evolution of Asset Allocation Process

- Ranges and asset categories have evolved over time
 - Initial implementation subjectively phased in
 - Highlighted importance of disciplined implementation
- Developed internal risk metrics for alternative asset categories to further quantify underlying risk of portfolio
- Good luck/ bad luck

SDRS Capital Markets Benchmark (CMB)

Proposed FY 27

	<u>Equity-Like Risk</u>	<u>Primary Asset Categories</u>					<u>Secondary Asset Categories⁴</u>			<u>Other Categories⁵</u>
		<u>Public Equity¹</u>	<u>Real Estate REIT/Core²</u>	<u>High Yield Debt</u>	<u>Investment Grade Debt¹</u>	<u>Cash³</u>	<u>Private Equity</u>	<u>Opportunistic Real Estate²</u>	<u>Hedge Funds</u>	
Minimum	40%	20%	0%	0%	13%	0%	0%	0%	0%	
Maximum	85%	75%	20%	15%	60%	45%	12%	15%	5%	5%
Proposed 2027 CMB	70%	56.3%	12%	7%	22.8%	1.9%				
Benchmark Index		(3/4) custom MSCI ACWI IMI ex Real Estate + (1/4) custom MSCI USA IMI ex Real Estate	MSCI US REIT	FTSE US High Yield Market	FTSE US BIG Bond	FTSE US 3-mo. Treasury Bill				
Benchmark History										
	2023-2026	56.3%	12%	7%	22.8%	1.9%				
	2016-2022	58%	10%	7%	23%	2%				

1. Buffer for market drift of 1% for public equity and 1/2% for debt (example: Investment Grade debt minimum of 13% can drift to 12.5%)
2. Real Estate(RE) min/max applies to REITs/Core RE and Opportunistic combined. Opportunistic RE counts 1.3x against RE max. Projected base case allocation used for partnerships
3. Cash to provide liquidity for benefits payments and rebalancing
4. Since 2015, secondary asset categories have not been included in the CMB. This change allowed the CMB to consist solely of well fitting, investable indexes. These categories continue to have a permitted range to invest in opportunistically.
5. Other categories, such as TIPS, commodities, and arbitrage have been considered or used in the past. They are not in the CMB. Future use would be limited to 5% or less.
